

Consolidated Service Center Solutions

Whether your health system is planning to build a new consolidated service center (CSC) or investigating ways to optimize and extend the life of an existing warehouse, Swisslog is your resource for complete hospital warehouse and distribution expertise.

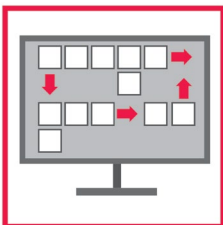

Warehouse Design and Concepting

Architectural planning stages can be the most complex part of a CSC implementation, and most health systems do not staff the internal expertise to coordinate this process. It's why hospitals rely on Swisslog to manage the entire warehouse design and concepting phase, including structural design, fire safety, building utilities and even HVAC. Our team of experts can assist you in designing the perfect building to optimize your flow of goods and anticipate future growth.

Automated Storage, Picking and Transport

Beyond the cost benefits of standardization from centralizing supply distribution, automating the processes within a CSC can drive substantial labor savings through enhanced pick-productivity and FTE avoidance. The return on the investment for this type of automation can play an important role in justifying the creation of a CSC. Health systems with existing CSCs can realize further cost avoidance by extending the life of their warehouses through significant storage footprint reduction.

Warehouse Management Software

At the heart of every consolidated service center is an intuitive software system that orchestrates material movement. Swisslog warehouse management software is actively managing the workflows of over 250 distribution centers worldwide, including complex retail, ecommerce and pharmaceutical supply chains. The foundation of all Swisslog healthcare solutions, this proven software platform enables connectivity across health systems, from pharmacy inventory management to complete chain-of-custody.

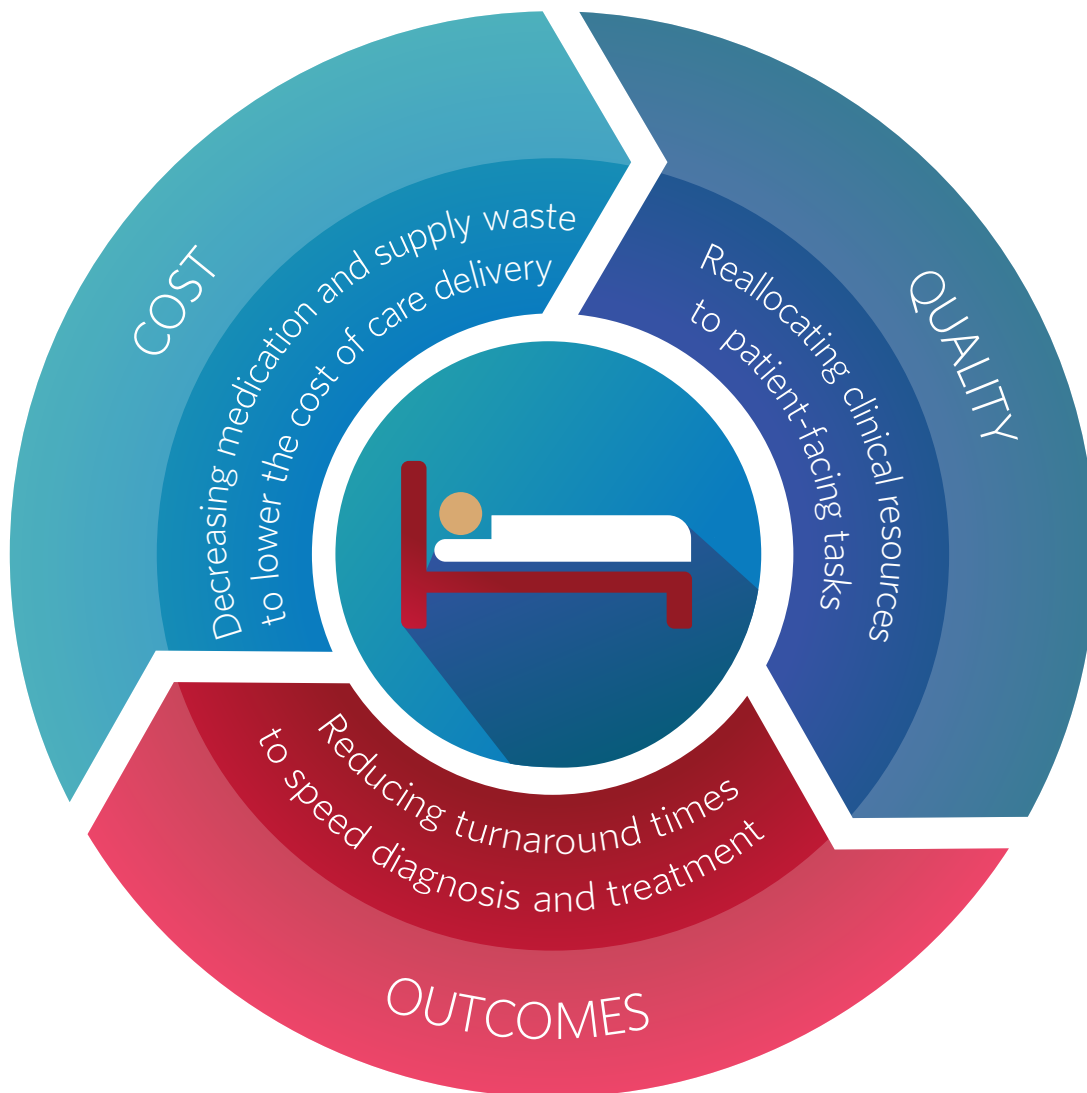

Centralized Pharmacy Distribution

As a significant cost center for health systems, management of pharmacy inventory is increasingly moving to the oversight of hospital supply chain organizations. Centralization of medication distribution within a consolidated service center is an effective way to decrease inventory overhead, reduce waste, manage drug shortages and improve processes through automation. In a Swisslog robotic pharmacy, the packaging, storing and dispensing of medication is entirely automated, significantly reducing the opportunity for errors and enabling redeployment of pharmacy staff.

Impacting Cost, Quality and Outcomes Across the Continuum of Care

Hospital supply chain organizations are closer to patients than ever before. From leading value analysis teams to lowering the cost of care delivery, gone are the days of simply managing materials. When supply chain accountability reaches far beyond the walls of a consolidated service center, shouldn't your technology partner?

At Swisslog, we do more than simply manage inventory and route orders. By integrating solutions for materials management, pharmacy and automated transport, only Swisslog connects supply chain to patient outcomes wherever care is delivered in your network.
